SUBJECT INDEX TO VOLUME 18

Analysis and localization of losses in an induction machine using a calorimetric method, 29
Application of optimization to the size and control settings of shunt capacitors on distribution feeders, 41
Approach to the analysis of fundamental frequency ferroresonance, 173
Asynchronous motor drives optimum control in transient behavior, 393
Automatic generation control of a hydrothermal system with new area control error considering generation rate constraint, 461

Compensation technique for Q-limit enforcements in a constant complex Jacobian power flow model, 71
Computation of the quasi-stationary magnetic field in steel laminations in presence of hysteresis, 429
Concepts of static VAR system control for enhancing power transfer in long transmission lines, 337
Controllable performance motor regulator, 549
Cylindrical x-y stepping drive, 163

Decoupled ranking of branch outages causing limit violations, 123
Design and performance of a microcontroller-based switched reluctance motor drive system, 359
Digital filtering methods of microprocessor based protective relaying, 195
Direct evaluation for the output frequency and the magnetizing reactance of three-phase isolated self-excited induction generators, 113

Effect of parameter variations on the stability limits of permanent magnet synchronous machines, 519

Fast method for the determination of break points for computer-aided coordination of directional relays, 53
Flow and heat transfer in radial channels of electric machines, 83

Harmonic balance analysis of the subharmonic ferroresonance, 409
High speed induction motor drive with active magnetic bearings and sliding mode decentralized control, 375

Identification of transient stability regions by utilization of local energy function measures, 535

Microprocessor based industrial load bus static VAR controller, 449

Modeling of multi-stage steam turbines for power system transient studies, 321
Modified current injection technique, 13

Optimal design of high voltage overhead transmission lines, 293
Overview of the reactive power allocation in electric power systems, 495

Parametric analysis of ferroresonance, including hysteresis effects, 473
Performance evaluation of PM machines with quasi-square input currents, 283
Phenomena that causes most severe transients in three-phase induction motors, 149
Power electronics control of reluctance series motor (RSM) for direct axle traction, 313

Static and tracking state estimation in power system using Newton's method, 97

Theory of a synchronous machine with a self-levitated rotor, 383
Three-phase induction motor design optimization using the modified Hooke-Jeeves method, 1
Transmission networks planning using quadratic programming, 137
